

This shows how text in various fonts appears when that font is not available and a substitution is made. The top text of a pair is in the named font. The lower text, which says the same, is in the font which will be used as a substitution. The idea is that we can see what the text looks like in the substitution font - we want the substitutions to be roughly the same weight, and perhaps most importantly, no wider. The text boxes are adjusted to the width of the text in the original font. The substitution is supposed to fit inside as well.
